LIVE BIRTHS, 1990

CHAPTER 1.

Description of Tables	1.0
Female Population, Child Bearing Age Groups (10-49)	1.1
Live Births	1.3
Birth Order	1.7
Birthweight	1.10
Live Births to Single Mothers	1.12
Live Births to Teenage Mothers	1.17
Live Births to Single Teenage Mothers	1.20

STILLBIRTHS, INFANT MORTALITY AND PERINATAL DEATHS, 1990

CHAPTER 2.

Description of Tables	2.0
Number of Stillbirths Among Married Females	2.1
Number of Stillbirths Among Single Females	2.2
Number of Infant Deaths and Death Rates	2.4
Number of Perinatal Deaths and Perinatal Death Rates	2.6
Major Causes of Early Neonatal Mortality - Males	2.7
Major Causes of Early Neonatal Mortality - Females	2.8
Major Causes of Late Neonatal and Post Neonatal Mortality - Males	2.9
Major Causes of Late Neonatal and Post Neonatal Mortality - Females	2.10

CHAPTER 3.

MALES DEATHS, 1990

Description of Tables	3.0
Male Population, All Ages	3.1
All Causes	3.3
All Cancer	3.7
Colon Cancer	3.11
Lung Cancer	3.15
Diabetes Mellitus	3.19
Ischemic Heart Disease	3.23
Cerebrovascular Disease	3.27
Pneumonia	3.31
Chronic Obstructive Lung Disease	3.35
Liver Cirrhosis	3.39
Congenital Anomaly	3.43
Motor Vehicle Accidents	3.47
Suicide	3.51
Prostate Cancer	3.55
Potential Years of Life Lost from Selected Causes	3.59

CHAPTER 4.

FEMALE DEATHS, 1990

Description of Tables	4.0
Female Population, All Ages	4.1
All Causes	4.3
All Cancer	4.4
Colon Cancer	4.11
Lung Cancer	4.15
Diabetes Mellitus	4.19
Ischemic Heart Disease	4.23

GENERAL FRAMEWORK

This is the eighth annual report dealing with natality and mortality patterns in Alberta, observed at the health unit level. This volume contains birth, infant mortality, and death statistics and related indices for the year 1990 for Alberta, disaggregated by the 27 Health Units, to the extent that this is possible from Vital Statistics data. All the birth and death data used in the preparation of this report originated with Alberta Vital Statistics. It is hoped this information will prove useful to those involved in planning at both the health unit and provincial levels. The report is divided into four chapters, dealing with births, stillbirths and infant mortality, deaths in the male population, and deaths in the female population, respectively.

By considering births and deaths on a health unit basis, this report acknowledges the differences that exist from one area of the province to another. It is not always possible to offer an explanation as to why such variation exists, and no attempt has been made in this volume to provide one. Any explanation would need to be based on a comprehensive understanding of the various demographic and socioeconomic characteristics of the health units and this knowledge is most readily available at the community level.

In data format this report closely resembles the seventh report published in March, 1991¹. The emphasis is on natality and mortality of individual health units as observed in 1990.

A point of view has been adopted that the situation for Alberta is mainly relevant in so far as it provides a convenient standard for gauging patterns in this province. To that end, all age-standardized rates in this report have been standardized on Alberta population in 1990.

As each new demographic indicator is introduced it is accompanied by the corresponding background material or mathematical formula.

Appendices A and B give the details of the demographic methods used.

CHAPTER CONTENTS

Each chapter begins with a description of the relevant population according to age groups, and follows with a series of tables and figures dealing with either births or deaths. The latter are organized according to a definite format. Within each chapter, pages are numbered consecutively. Tables and figures will be identified by referring to the corresponding page number.

BIRTH AND DEATH STATISTICS

A proper interpretation of the tables and figures in the pages that follow requires an understanding of some of the features of the Alberta Vital Statistics registration and reporting system. As each birth or death is registered, Alberta Vital Statistics assigns the vital event to a health unit on the basis of the registrant's place of usual residence, provided, of course, that the individual involved is an Albertan. This may or may not be the health unit where the vital event took place.

Alberta Vital Statistics also registers births and deaths involving residents of other provinces and countries, but these will not be considered here. By the same token, if a resident of Alberta gives birth or dies while outside this province, the registration will not be known to Alberta Vital Statistics. This results in a small degree of undercounting of vital events involving Albertans. However, this shortfall is not very large, approximately 481 Live births (1.1%), 5 Stillbirths (1.7%), 7 Infant deaths (2.2%) and 119 deaths (0.9%) in 1990².

An exception to the above method of reporting has to do with residents of certain Indian reservations. Because of a special arrangement between the neighbouring health units and Alberta Vital Statistics, births and deaths identifiable as involving residents of these reservations are not assigned to the health unit in question, but rather given their own identifiers^{3,4}. This makes it impossible to assign these vital events to a health unit without going back to the original registrations. Consequently, these statistics have been excluded from the present report. However, data from Alberta Vital Statistics indicate that the resulting undercounting is very small.

Alberta Vital Statistics publishes an annual report containing, along with other information, birth and death statistics. In theory, the entries in the 1990 report should coincide exactly with those given here. However, certain discrepancies can be found. For example, Alberta Vital Statistics sets the total number of deaths (Alberta residents only) at 13,835 which is to be compared to 13,716 (excluding Indian Reservations) computed from Table 3.3 and Table 4.3 in this report. This difference is partially due to the fact that in this report only those cases with specific Health Unit codes are included. Other similar discrepancies may occur because the Alberta Vital Statistics system is a dynamic one, with registrations being updated, late registrations being filed and similar data modifications made continuously. These differences are not very important for the computation of health indices used in the report. More specifically, the health unit related rates provided in this report are unlikely to change.

POPULATION ESTIMATES

Since this report is concerned with births and deaths it is necessary to have population estimates in order to compute rates.

In certain health units, up-to-date enumerations are available as they have been included in a municipal census. However, in order to have a uniform method applicable to all health units, it was decided to estimate all 1990 health unit population by projecting the health unit enumerations from the national census of 1986. The details of the method of projection are given in Appendix A.

SMALL AREA STATISTICS

The preceding sections dealt with some of the characteristics of the statistics that have been used in this report. A related consideration has to do with the problem of small area statistics^{5,6}. This refers to the difficulties, inherent in the analysis of statistics, arising out of relatively sparsely populated areas. Because of the small numbers involved, indices computed from such statistics tend to be subject to random fluctuation. In the context of the present report, differences that appear to exist between one health unit and the next may be partly due to chance variation.

CHAPTER 1

LIVE BIRTHS

1990

DESCRIPTION OF TABLES

Chapter 1 lists live births by Alberta health units for the year 1990.

Table 1.1 gives population estimates for females in the reproductive years (10-49) by five-year age groups, computed using the method described in Appendix A. Note that in this table the far right column gives the total number of females in each health unit and that the bottom row gives the health unit total for each age group. Also, in each table, "Alberta" is used to refer to health unit totals and actual provincial figures may slightly differ.

Table 1.2 is derived directly from Table 1.1, and gives the percent of the population in each health unit falling in each of the age groups in the range 10-49. Due to rounding the row totals may not sum up to 100.

Table 1.3 gives the number of live births by age group and health unit. Once again the total for each health unit and the grand total are provided.

Table 1.4 gives the age-specific live birth rates (per 1,000 females). These rates, sometimes called fertility rates, are defined by

$$\frac{\text{number of live births to women in age group}}{\text{number of women in age group}} \times 1,000.$$

Although not shown, it is possible to assign confidence intervals to each of the rates in this table along the lines of Table 1.5. The method of computation is described in Appendix B. Because of the small numbers involved in some of the health units, the age-specific rates in this table would be expected to have rather wide confidence intervals. For this reason Table 1.4 should be interpreted with

caution, especially when health units are being compared.

Table 1.5 has a number of indices related to the age-standardized live birth rates. The technique of age-standardization is discussed in Appendix B. In the present case, rates have been standardized to the 1990 Alberta female population, ages 10 to 49. This means that each of the age-standardized rates, appearing in the first column of the table (where they are referred to simply as rates), is the live birth rate that would have been observed in each health unit in 1990 if the age distribution of women in the reproductive years in the health unit had been precisely the same as that observed in Alberta as a whole in the year 1990. This adjustment for differing age distributions (see Table 1.2) corrects for a potential source of artifactual error.

Associated with each of the (age-standardized) rates is a 95% confidence interval, with lower and upper limits, shown in columns two and three. For details of the method of computation see Appendix B. These numbers bound the observed rate from below and above, respectively, and thereby give a range of numbers which include the true underlying rate with a 95% confidence level. The observed rate is simply one manifestation of the true underlying rate, which cannot be known with 100% confidence because of random variation. This means that the true underlying rate could be as small as the lower bound or as large as the upper bound. Typically, the larger the population in question, the narrower will be the confidence interval. Because they indicate the reliability of the observed rate, the lower and upper confidence limits should always be considered along with the rate.

In the fourth column the rates (excluding that for Alberta) have been ranked from 1 to 27, with 1 for the largest rate and 27 for the smallest.

The fifth column gives ratios, computed by dividing the rate for each health unit by the Alberta rate. This gives a measure of the relative magnitude of the rate for each health unit compared to Alberta as a whole. The ranks and ratios are simply different ways of looking at the rates in column one.

The final column records the results of statistical testing for a difference between the rate for each of the health units and the rate for Alberta. The principles involved are described in Appendix B. If the health unit rate was found to be larger than that for Alberta, and statistically significantly so, then a "Yes" was entered next to the health unit. If the health unit was observed to be less than the Alberta rate, or larger but not statistically significantly larger, then a dot was entered. Another approach to statistical testing would have involved looking for significant departures of the health unit rates from the Alberta rate, whether higher or lower, and not just higher as in this report. However, this would have meant using a test with less sensitivity to detect higher than average health unit rates. Since these are the departures which tend to be of most interest (especially in the case of death rates), the present approach was adopted.

It must be reiterated that statistical significance is purely a property of numbers; as a concept it has no biological, demographic or social content. Consequently, even if two rates are determined to be different in a formal statistical sense, it is another matter as to whether or not they are different in a biological (or other) sense. This is a judgement to be made by the informed reader; it is outside the realm of statistical testing.

Figure 1.6 is a map of health units with the ranks from Table 1.5 inscribed. This provides a convenient method of searching for cluster of low or high ranks.

Tables 1.7 to 1.9 give the number of live births by birth order, where "first order" means the first live birth for the woman and similarly for higher orders of births.

Table 1.10 and Table 1.11 give a breakdown of live births by weight category.

Tables 1.12 to 1.14, and Figure 1.15 are similar in layout (and interpretation) to Tables 1.3, 1.4, 1.5 and Figure 1.6, respectively. Here attention is restricted to live births to women who were single (that is, not legally married) at the time of birth.

Table 1.16 is computed directly from Table 1.12 and gives the percent of the live births occurring in each age group.

Tables 1.17 and 1.18, and Figure 1.19 are formatted along the lines of Tables 1.3, Tables 1.5 and Figure 1.6, respectively. However, here a single age group, the 15-19 year olds, is considered in detail. Consequently, the age-specific and age-standardized rates coincide.

Tables 1.20 and 1.21, and Figure 1.22 consider the live births and birth rates to single teenage mothers.

1.22

CHAPTER 2

STILLBIRTHS, INFANT MORTALITY

AND PERINATAL DEATHS

1990

DESCRIPTION OF TABLES

This chapter presents detailed information on stillbirths and infant mortality in Alberta health units. First, data for stillbirths are provided. This is followed by infant mortality rates, which include perinatal, early neonatal, late neonatal and post-neonatal mortality. The following figure illustrates the concept of stillbirths and infant mortality.

FIGURE

Tables 2.1 and 2.2 give the number of stillbirths among married females by age group and health units. Once again, the totals for the health units and Alberta are provided. Similarly, Table 2.2 shows the number of stillbirths among single females.

Table 2.3 presents the stillbirth ratios (per 1,000 live births) for the health units and Alberta. Stillbirth ratios are defined by:

$$\frac{\text{stillbirths}}{\text{live births}} \times 1,000$$

It is the number of stillbirths relative to the number of live births. Since stillbirth statistics are less reliable than desirable, stillbirth ratios should be interpreted with caution.

Table 2.4 shows the number and rate of infant deaths for each health unit. Infant death rate is defined by:

$$\frac{\text{number of deaths under 1 Year of Age}}{\text{number of live births}} \times 1,000$$

It should be noted that in 1990 there was a total of 323 infant deaths in the health units of Alberta. Another 12 occurred in Indian reserves, and 15 infant deaths were recorded without any health unit codes. Thus, the infant deaths and the rates shown in this table deal with 92% of the total Alberta infant deaths.

Table 2.5 gives the age distribution of infant mortality (early neonatal, late neonatal, and post-neonatal deaths).

Table 2.6 gives the number of perinatal deaths and perinatal death rates (per 1,000 births). Perinatal deaths consist of stillbirths and deaths within the first week of life. The perinatal death rate is defined by:

$$\frac{\text{stillbirths and first week deaths}}{\text{stillbirths and live births}} \times 1,000$$

Since stillbirth statistics are somewhat unreliable, as mentioned earlier, perinatal death rates must be interpreted with caution.

Tables 2.7 and 2.8 show the number and percentage of three major causes of early neonatal mortality, from 1988 to 1990 inclusive, for males and females, respectively.

Tables 2.9 and 2.10 give the number and percentage of three major causes of late neonatal and post-natal mortality, from 1988 to 1990 inclusive, for males and females, respectively.

The International Classification of Diseases - ninth revision (ICD-9) rubrics used in Tables 2.7 to 2.10 are as follows:

CAUSE OF DEATH	ICD-9 RUBRIC
Congenital	740.0 - 759.9
Respiratory	769.0
SIDS	798.0
Other	All other codes

CHAPTER 3

MALE DEATHS

1990

DESCRIPTION OF TABLES

Chapter 3 deals with deaths in the male population for the year 1990, by health units of Alberta. Ideally, five-year age groups are used for the purpose of standardization. However, in this report somewhat broader age groups have been used. These have been defined by aggregating five-year age groups in such a way as to cover meaningful periods in the lifespan. For example, 5-14 for the school years, 15-24 for early adulthood, etc.

The age-specific male death rate (per 100,000 males) is defined by:

$$\frac{\text{number of deaths to males in age group}}{\text{number of males in age group}} \times 100,000$$

The age-standardized death rates in this chapter have been standardized to the estimated male population of Alberta in 1990. So for each health unit, the male age-standardized death rate for a given cause equals the death rate that would have been observed in that health unit if it had had the age distribution of males in Alberta as a whole in 1990.

The format for this chapter is basically the same as that used in Chapter 1. Following a description of the population by age group, there is a series of four page sections. Each section deals with a specific cause of death. Note that death rates should be interpreted with considerable caution. Since there are far fewer deaths than live births per year, and the deaths are spread out over both sexes and all age groups, the tables here are much sparser looking than those of Chapter 1. As a result, the confidence intervals for the age-standardized death rates are generally quite wide. To an even greater degree this remark applies to confidence intervals for age-specific death rates (not shown). When a confidence interval lower

limit extended into the negative numbers, it has been reported as such; another approach would have been to arbitrarily set it equal to zero. In certain cases several health units were found to have identical (age-standardized) rates. When this happened, ranks for these health units were assigned randomly rather than giving each of the health units involved the same intermediate rank. For the most part, ties were due to several health units having no deaths due to a cause, and hence a rate of zero. Note that death rates are given per 100,000 males, whereas live birth rates are per 1,000 females.

The causes of death selected for study along with the rubrics according to the ICD-9 are as follows:

CAUSE OF DEATH	ICD-9 RUBRIC
All Causes	1 - 999
All Cancer	140 - 208
Colon Cancer	153 - 154
Lung Cancer	162
Prostrate Cancer	185
Diabetes Mellitus	250
Ischemic Heart Disease	410 - 414
Cerebrovascular Disease	430 - 438
Pneumonia	480 - 486
Chronic Obstructive Lung Disease	490 - 493, 496
Liver Cirrhosis	571
Congenital Anomaly	740 - 759
Motor Vehicle Accidents	810 - 819
Suicide	950 - 959

The causes have been ordered in the table and in the chapter in ascending order of rubric number, except for prostate cancer which has been placed at the end of the Chapter. Because of this arrangement, the tables and figures in this Chapter correspond by page numbers.

In an attempt to concentrate even more attention on premature death, one might calculate years of life lost using only those deaths which occurred before a certain age and, eventually, consider only the years of life lost before this age limit. The indicator Potential Years of Life Lost (PYLL) is designed to take into account both of these two possibilities and is thus an excellent indicator of premature mortality.

More specifically, the indicator PYLL provides an estimate of the total years of life lost before age 70, by persons deceased between their 1st and 70th birthdays. For each death considered, the duration of life lost before age 70 is defined as the time interval separating death from the 70th birthday. For a given cause, the total potential years of life lost depend only on the number and mean age of its victims between age 1 and 70'.

Thus, Table 3.59 shows potential years of life lost from selected preventable causes. Charts 3.60 and 3.61 are presented to illustrate this data.

Since there are 27 health units in the province of Alberta, and also, given the small population size of quite a few health units, a comparison of distribution of PYLL by gender and causes would be more appropriate on a regional basis.

The regions selected for this purpose are the ones adopted by the Health Unit Association of Alberta and currently have no statutory basis.

CHAPTER 4

FEMALE DEATHS

1990

DESCRIPTION OF TABLES

This chapter deals with deaths in the female population for the year 1990, by health units of Alberta. The layout of Chapter 4 is identical to that of Chapter 3, except that it includes female breast cancer instead of prostate cancer.

page numbers.

The causes of death selected for study are listed along with rubrics below:

CAUSE OF DEATH	ICD-9 RUBRIC
All Causes	1 - 999
All Cancer	140 - 208
Colon Cancer	153 - 154
Lung Cancer	162
Female Breast Cancer	185
Diabetes Mellitus	250
Ischemic Heart Disease	410 - 414
Cerebrovascular Disease	430 - 438
Pneumonia	480 - 486
Chronic Obstructive Lung Disease	490 - 493, 496
Liver Cirrhosis	571
Congenital Anomaly	740 - 759
Motor Vehicle Accidents	810 - 819
Suicide	950 - 959

The causes have been ordered in the table and in the chapter in ascending order of rubric number, except for female breast cancer which has been placed at the end of the chapter. Because of this arrangement, the tables and figures in this chapter correspond by

APPENDICES

APPENDIX A

METHOD OF POPULATION PROJECTION

In this appendix the method of health unit population projection used in the report is described. The statistics needed consist of: the 1986 health unit census (Federal) enumeration and the 1990 age and sex distributions of the Alberta population published by the Alberta Bureau of Statistics. It should be noted that the 1986 census exclude one or more incompletely enumerated Indian reserves or Indian settlements. All of these statistics are available through the Alberta Bureau of Statistics.

The method of projection simply scales the 1986 census population of each health unit, by age group and by sex, according to a factor which relates the 1986 population of Alberta to that of 1990 estimates.

For a given sex let $n_i(86)$ equal the number of individuals in the i^{th} age group of the j^{th} health unit in 1986, and let $N_i(86)$ equal the number of individuals in the i^{th} age group in Alberta as a whole in 1986. For Chapter 1 and Chapter 2 there are eight age groups, and for Chapter 3 and Chapter 4 there are ten. The corresponding numbers for 1990 are $n_i(90)$ and $N_i(90)$. The problem is to estimate $n_i(90)$ from $n_i(86)$, $N_i(86)$ and $N_i(90)$, and the problem is solved by:

$$f_i(86,90) = \frac{N_i(90)}{N_i(86)} .$$

Then $f_i(86,90)$ scales the 1986 Alberta population in the i^{th} age group to that of 1990 in the sense that $f_i(86,90) N_i(86) = N_i(90)$. The projected estimate of $n_i(90)$ is then defined by

$$n_i(90) = f_i(86,90) n_i(86) .$$

Note that the same factor $f_i(86,90)$ is used for the i^{th} age group for all health units and so the assumption has been made that there has been a uniform rate of growth (or decline) common to all health units.

APPENDIX B

TECHNIQUES OF AGE STANDARDIZATION

In this section the standardization methods and statistical techniques used in the report are described. The discussion applies to both live birth rates and death rates of 1990. For concreteness the discussion will be phrased in terms of death rates.

As in Appendix A, let n_i equal the individuals in the i^{th} age group of the j^{th} health unit (for a given sex and year) and let d_i be the corresponding number of deaths (for a given cause). Summing n_i and d_i over the index j (that is, over all health units) results in the number of individuals and deaths in the i^{th} age group in Alberta as a whole, denoted by N_i and D_i , respectively. The total number of Albertans and the total number of deaths are obtained by summing N_i and D_i over the index i , and will be denoted by N and D , respectively.

The death rate for the i^{th} age group and j^{th} health unit is defined by:

$$r_{ij} = \frac{d_{ij}}{n_{ij}},$$

and the corresponding rate for Alberta defined by

$$R_i = \frac{D_i}{N_i},$$

The standard error of r_{ij} may be estimated* by

$$SE(r_{ij}) = \frac{d_{ij}^{1/2}}{n_{ij}},$$

and a 95% confidence interval constructed from

$$r_{ij} \pm 1.96 SE(r_{ij}).$$

Formulas are similarly defined for R_i in this report.

The age standardized death rate for the j^{th} health unit, standardized to the Alberta population, is defined by

$$sdr_j = \sum_i w_i r_{ij},$$

where;

$$w_i = \frac{N_i}{N}.$$

Consequently, sdr_j is a weighted average of age-specific death rates for the j^{th} health unit, where the weights W_i are determined by the Alberta age distribution. For the (one-sided) hypothesis that sdr_j is greater than SDR, the test is significant (at the 5% level) if

$$Z \geq 1.64 .$$

The standard error of sdr_j is defined by

$$SE(sdr_j) = (\sum_i [w_i SE(r_i)]^2)^{1/2} .$$

Since age-standardization is according to the Alberta population, the age-standardized death rate for Alberta, given by

$$SDR = \sum_i w_i R_i ,$$

simplifies to,

$$SDR = \frac{D}{N} ,$$

which is usually referred to as the crude death rate. From an earlier formula,

$$SE(SDR) = \frac{D^{1/2}}{N} .$$

A test of the hypothesis that the standardized rate for the j^{th} health unit differs from the Alberta rate may be based on Z - statistic,

$$Z = \frac{sdr_j - SDR}{[SE(sdr_j)^2 + SE(SDR)^2]^{1/2}} .$$
